## <u>ABSTRACT</u>

A scripting approach to managing the test bench complexity issue is provided. Partitioning the functionality of a test bench between Verilog and a scripting language allows for a significant reduction in compile times during ASIC verification. If done correctly, partitioning also offers great potential for re-use of test bench components. The Tcl language was chosen as a basis for implementing a library of PLI routines that allow fully customizable interpreters to be instantiated in Verilog test benches. This library allows multiple Tcl interpreters to be instantiated in a Verilog simulation. The Tcl interpreters can interact with the simulation and cause tasks to be executed in the Verilog simulation. It has been found the TCL\_PLI library is extremely valuable in speeding up verification efforts on multi-million gate ASICs.
